Abstract

This project presents 'AgriMart', a digital platform that connects farmers directly with customers. The system provides real-time crop price updates, secure online ordering, and smart delivery management. An AI-powered chatbot assists farmers and customers in multiple languages (Telugu, Hindi, English), while a machine learning model detects and predicts crop diseases from images. The platform ensures transparency, fair pricing, and trusted transactions in agriculture.

Domains where AgriMart can be implemented

AgriMart can be applied in direct farmer-to-customer sales**,** farmer producer organizations (FPOs)**,** urban and rural fresh produce delivery systems**,** agri e-commerce platforms**, and** smart farming advisory services**. It ensures fair pricing, transparency, and efficient crop distribution.**

Our Solution Helping the selected Domains

AgriMart supports direct farmer-to-customer sales, giving farmers fair prices and customers fresh produce. It helps farmer groups and cooperatives reach wider markets and improves urban and rural delivery of crops. As an agri e-commerce platform, it can also cover seeds, fertilizers, and farm essentials, while in smart farming advisory, it offers multilingual chatbot support, and crop disease detection.

Our Engineering Solution

AgriMart is built using web and mobile platforms connected to a secure database for managing crops, farmers, customers, and orders. It integrates government APIs for real-time price updates, uses ML models for crop disease detection and prediction, and includes an AI-powered multilingual chatbot to assist users. An admin dashboard ensures smooth order tracking, transport management, and secure payments.

Team's vision

Our vision is to develop a **trusted and intelligent agricultural marketplace** that empowers farmers with fair pricing, connects customers with fresh produce, and ensures transparent transactions.
